# Response Time

[Deborah J. Mayhew]

Task Time =

- System Response Time
- + System Display Rate
- + User Scan/Read Time
- + User Think Time
- + User Response Time
- + Time Making Errors
- + Time Recovering from Errors

# Adaptive user strategies to varying system response (RT) and error recovery (ER) times

- **Fast RT, Fast ER**  
Low user think time  
High user errors  
High user satisfaction  
Low stress
- **Fast RT, Slow ER**  
Moderate
- **Slow RT, Slow ER**  
High user think time  
Low user errors  
Low user satisfaction  
High stress

# Response Time: Principles and Guidelines [1]

- ◉ Optimal display rate depends on the user's task.
- ◉ Response time for intermediate steps in a process should not exceed 2 second.
- ◉ Keep response time variability at less than + 50 % of the mean.

# Response Time: Principles and Guidelines [2]

- Make the sources of response time variability visible.
- Make ease of learning and use versus response time trade-offs based on user experience and expectations.

# Response Time: Principles and Guidelines [3]

- Response time should be consistent with user expectation.
- Manage user expectation with feedback

**Table 7.2** Suggested response time ranges for operations of varying perceived complexity [Shneiderman, 1980].

Interaction type	(T)	Example Time
<ul style="list-style-type: none"><li>• Input</li><li>• Direct manipulation</li><li>• Simple commands</li><li>• Paging</li><li>• Simple error checking</li><li>• Open file</li></ul>	< 2 seconds	
<ul style="list-style-type: none"><li>• Complex commands</li><li>• Load application</li><li>• Move across file</li><li>• Search</li></ul>		2 to 12 seconds
<ul style="list-style-type: none"><li>• Complex processes</li><li>• Spelling checker</li><li>• Batch transaction processing</li></ul>
