

Web Security

Girindro Pringgo Digdo

Whoami

- Seven years in Information Security
- Lecturer
- Author

Agenda

- Server Security
- Client Security

Server Security

- Server system consist of:
 - Client
 - Server
- Facilities
 - GET Method
 - File
 - Command Execution
 - ?

Issues

- The information changed so that it could be lead the bad mark of company or organization
- The information that should be consumed for a limited (i.e. financial statements, the company's strategy, or client database) was successfully intercepted by your rival
- The information can be tapped (such as sending a credit card number to purchase via www)

Issues

- Your server was attacked so it can not provide services when needed (denial of service attack);
- For a web server that is behind a firewall, a security hole in web server which can be exploited to weaken or even eliminate the function of the firewall.

Web Security

- Access Control
 - Everyone not need the access
 - Limit the domain or IP Address for access
 - Use account pair (user and password)
 - Data encryption so that it could be opened by right person
- Protect the page with password
- Use Secure Socket Layer (SSL) for login or transmission the classified information

Web Security

- Knowing the Server

Information about server could be used by attacker to attack the system. They search weakness about system and then attack.

- Server Side Scripting Security

- Use secure coding

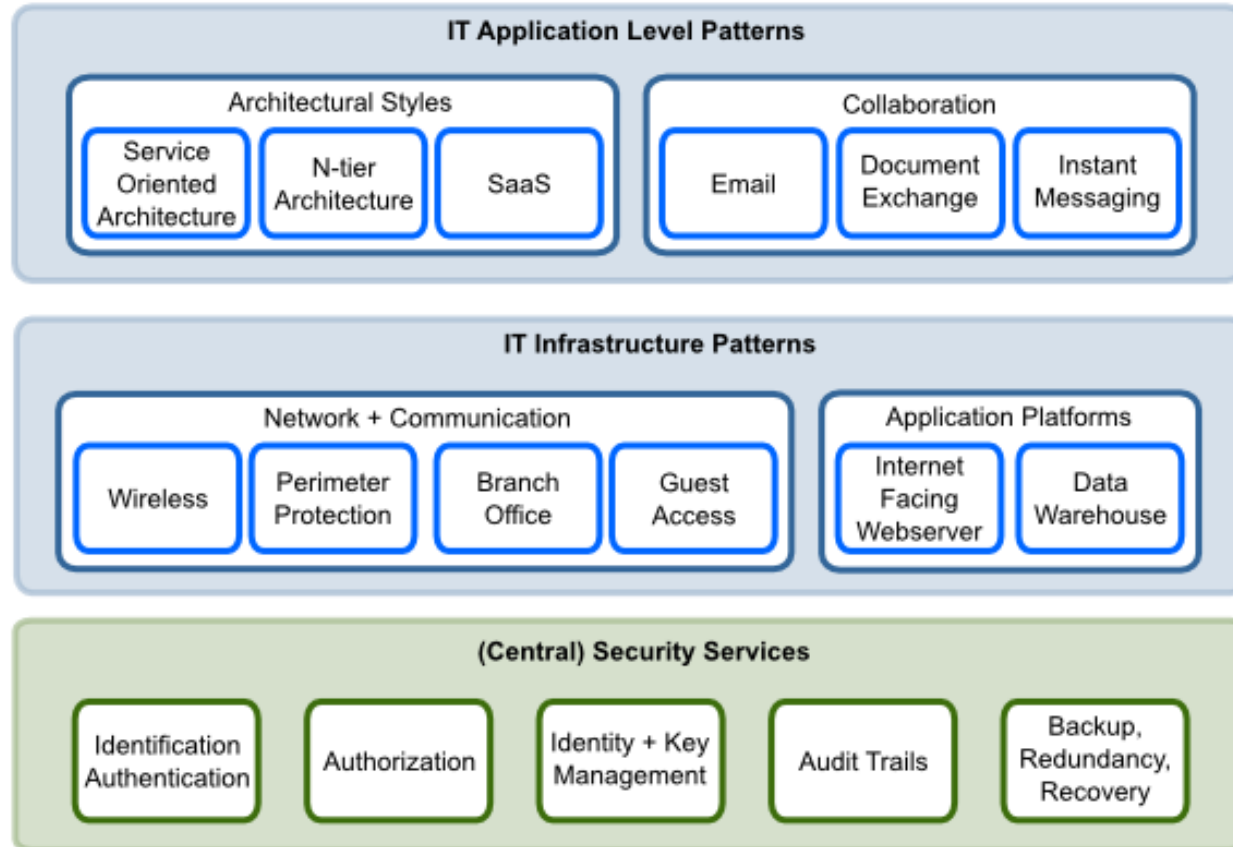

Client Security

- Be careful to click the link. Without awareness, it could lead you to malicious software
- The page could execute malicious command.

Task

- Make a Security Architecture Pattern
- Explain each component of pattern
- Send to girindigdo@gmail.com
